TITLE: Electrosynthesis of Nicotinic Acid (Elektrosintez nikotinovoy kisloty)

PERIODICAL: Zhurnal obshchey khimii, 1958, Vol 28, Nr 10,
pp 2898 - 2902 (USSR)

ABSTRACT: Only few papers have been published on the electro-chemical oxidation of β -picoline into nicotinic acid and of quinoline into quinolinic acid which is readily decarboxylized into the former. Thus attempts have been made to convert the α -, β - and γ -picolines into the corresponding aldehydes by means of electrical oxidation, but yields were poor (Ref 1). In the same way, the electrolytical oxidation of β -picoline into nicotinic acid was carried out in 30% sulfuric acid, and that of quinoline into quinolinic acid was carried out in 75-80% (Ref 2). There are also well-known attempts to obtain nicotinic acid from nicotine, anabasine, and N-methylanabasine by means of electrosynthesis

Card 1/3

Electrosynthesis of Nicotinic Acid

SOV/79-28-10-59/60

(Refs 4-6). The electrochemical synthesis of the two acids is of great interest as it dispenses with oxidizing agents and catalysts; however, publication data on this synthesis do not suffice to warrant its practical utilization. In the paper under consideration, which deals with the electrochemical oxidation of β -picoline, the authors have investigated the influence on the nicotinic acid yield of the current quantity flowing through the electrolyte, of the current density, temperature, of the added quantities of Mn^{++} and Cr^{+++} , of the β -picoline concentration and of the sulfuric acid concentration. An investigation was also made into the effect of the conditions under which the electrolysis is carried out on the speed of the electrooxidation of β -picoline into nicotinic acid. In addition to this, the influence of the concentration of sulfuric acid and of quinoline on the quinolinic acid yield in the electrooxidation of quinoline was examined. There are 2 figures, 6 tables, and 9 references, 5 of which are Soviet.

TITLE: Catalytic Reduction of the Halogen-Alkyl Substituted Aromatic Nitrocompounds (Kataliticheskoye vosstanovleniye galogenalkilzameshchennykh aromaticheskikh nitrosoyedineniy)

PERIODICAL: Zhurnal obshchey khimii, 1959, Vol 29, Nr 4, pp 1353 - 1358 (USSR)

ABSTRACT: In the present paper is shown that a secondary alkylation reaction of the aromatic amine with the not yet reduced halogen-alkyl substituted aromatic nitrocompound is the reason of the small yields of o-4-xylidine (II) which is formed in the case of the hydrogenation of 2-chloro-methyl-4-nitrotoluene (I) in the presence of the skeleton nickel catalyst. The produced amine (III) is then hydrogenated into xylylidine (IV) which is isolated and easily determined with respect to structure by an analysis which is directed towards the primary amino group (Scheme). The catalytic hydrogenation of (I) is apparently complicated by the formation of the triamine (VI) on the strength of the alkylation of the secondary amine (III) by (I) into the tertiary amine (V) which for its part is transformed into (VI) by a further reduction. The triamine (VI) could be easily obtained by the alkyla-

Card 1/2

Catalytic Reduction of the Halogen-Alkyl Substituted Aromatic Nitrocompounds SOV/79-29-4-67/77

tion of the compound (III) in the presence of sodium bicarbonate and immediately by the alkylation of the o-4-xylidine (II) in a neutral medium. In the presence of pyridine the monoalkylation reaction yields only 75% since a side formation of the quaternary pyridine salt with (I) takes place. On the strength of this fact the dialkylation reaction in the presence of pyridine does not take place. It was shown that the alkylation products of o-4-xylidine (II) with (I) are in the case of the reduction with hydrogen subjected to a hydrogenolysis in the presence of the palladium catalyst as well as in the presence of the skeleton nickel catalyst, in the last case best at 100° under pressure. 5 hitherto unknown compounds were obtained. There are 2 references, 1 of which is Soviet.

TITLE: Nucleotides, coenzymes, phosphate esters. XI. On the migration of secondary O-phosphate groups with riboflavin phosphates

SOURCE: Zhurnal obshchey khimii, v. 36, no. 10, 1966, 1749-1752

TOPIC TAGS: phosphate ester, coenzyme, phosphate, hydrolysis, vitamin

SUB CODE: 07

ABSTRACT: An effort was made to prepare riboflavin phosphate, phosphorylated on the secondary (2',3',4') hydroxyl groups, the primary hydroxyl group of riboflavin being protected with a trityl group. It was found that phosphorylation of 5'-tritylriboflavin with beta-cyanoethyl phosphate yields the corresponding substituted phosphate ester, 5'-tritylriboflavin-2',3',4'-tri(beta-cyanoethyl) phosphate. When the protective groups (trityl and beta-cyanoethyl) were removed by successive treatment with 10% acetic acid and 2N ammonia solution, the only reaction product was riboflavin-5'-phosphate, instead of the expected riboflavin-2',3',4'-triphosphate, indicating a migration of the phosphate residue from the secondary to the primary group.

primary hydroxyl group in riboflavin-2',3',4'-triphosphate and simultaneous hydrolysis of the remaining phosphoester groups at the secondary hydroxyls. The same riboflavin-5'-phosphate was the only reaction product when the protective groups were removed in the opposite sequence. Beta-cyanoethyl phosphate smoothly phosphorylates riboflavin under mild conditions, yielding riboflavin-5'-(beta-cyanoethyl) phosphate. The latter is entirely converted in acid medium to riboflavin-5'-phosphate, without any admixture of polyphosphate esters.

TITLE: Nucleotides, coenzymes, phosphate esters. XII. Synthesis of riboflavin-5'-diphosphate with participation of trichloroacetonitrile as a condensing agent

SOURCE: Zhurnal obshchey khimii, v. 36, no. 10, 1966, 1753-1755

TOPIC TAGS: coenzyme, phosphate ester, vitamin, orthophosphoric acid, phosphorylation

SUB CODE: 07

ABSTRACT: A detailed study was made of the phosphorylation of riboflavin by orthophosphoric acid under various conditions. Increasing the duration of the phosphorylation was found to result in the formation of substantial amounts of riboflavin-5'-diphosphate and polyphosphate esters of riboflavin. The addition of triethylamine during phosphorylation in pyridine medium greatly inhibits the phosphorylation reaction. The addition of a condensing agent, trichloroacetonitrile, resulted not only in the production of riboflavin-5'-monophosphate and riboflavin-5'-diphosphate, but also two new compounds, probably imido esters of riboflavin-5'-diphosphate.

Card 1/2

monophosphate and riboflavin-5'-diphosphate. Phosphorylation of riboflavin-5'-phosphate by orthophosphoric acid in the presence of the condensing agent trichloroacetonitrile was found to lead to the formation of riboflavin-5'-diphosphate. There was practically no formation of riboflavin-5'-diphosphate from the monophosphate under the same conditions in the absence of trichloroacetonitrile.

TITLE: Study of the Shape and Size of X-ray Interference
Spots of Elastically-deformed Transformer Steel

PERIODICAL: Kristallografiya, 1960, Vol. 5, No. 6,
pp. 896 - 903 + 1 plate

TEXT: The reflections of X-rays from loaded and unloaded polycrystalline samples of transformer iron have been studied using an X-ray camera with an equivalent convergence of the X-ray beam of 9-15°. 40 specimens were studied and reversible changes in the interference spots occurred only in 10 of them. The relative quantity of spots changing in a reversible manner was very small - 1-5% in the majority of cases and never greater than 12%. Thus it can be assumed that reversible changes in grains in the process of elastic extension is a rare phenomenon. There were three main types of elastic changes in the grains of the polycrystal: a decrease in perfection of the crystallites; an increase in

Study of the Shape and Size of X-ray Interference Spots
of Elastically-deformed Transformer Steel

perfection of the crystallites, and intensive rotation of several crystallites. A decrease in perfection was shown by an increase in size of the spots in the direction of the acting stresses and also in a tangential direction. An increase in perfection was shown by a decrease in size of the spots, a decrease in their intensity and the disappearance of individual spots. Rotation of crystallites was shown by the interrelated displacement and rotation of spots and also from changes in the ratio of intensity of the components of the K_{α} -doublet. It was established that, as a rule, during elastic deformation, the reflections from the most imperfect crystallites change. This was as a result of considerable local stress gradients in, and in the neighbourhood of, the grain boundaries. The microstresses

TITLE: X-ray investigation of structure of transformer iron under elastic load and in process of relaxation of stresses

CITED SOURCE: Sb. Relaksats. yavleniya v met. i splavakh. M., Metallurgizdat, 1963, 303-308

TOPIC TAGS: steel, transformer steel, x-ray investigation, elastic load, stress relaxation

TRANSLATION: Investigates change of transformer steel substructure, subjected to elastic and plastic flow, and also prolonged macroelastic load. All forms of load and deformation of samples are conducted directly in an X-ray chamber. There is used the method of a wide convergent micro-

bu
Card 1/3

ACCESSION NR: AR4042234

bundle; investigates reflections from planes (310) in CoK α -radiation. There are determined disorientation and degree of perfection fragments in the grain, and also the quantity of reflexes on the X-ray photograph. In the macroelastic region load there is observed mutual turn of fragments in one crystallite, a mutual turn of grains and change of range orientations in radial and azimuthal directions. In region of low plasticity substructural changes, observed under macroelastic load, with transition beyond the limits of elasticity (~ 30 kg/mm) are developed in the direction of decrease of perfection of crystallites. After small plastic flow there is observed reversibility in change of dimensions and form of reflexes. Prolonged load (1000 - 16000 hrs) in macroelastic region leads to decrease quantity of reflexes on X-ray photograph; disappearance of certain reflexes is partially compensated by appearance of new ones. During prolonged load beyond the limits of elasticity there is observed qualitatively the same phenomenon, intensely occurring basically only at the initial moment of load. Concludes that structural changes in steel both during elastic and low plastic flow, and also under constant load in time have a more or less common character and are the result of consecutive episodical processes of relaxation of stresses in microvolumes. TITLE: A Device for Testing Tachometers (Ustanovka dlya proverki takhometrov)

PERIODICAL: Energetik, 1958, Nr 8, pp 24 (USSR)

ABSTRACT: The device described consists of a gearing system driven by an electric drill and by which any number of rpms may be selected from 70 to 2,000 rpm. The assembly is connected to the tachometer to be tested and also to a collector-pulsator. This transforms direct current into alternating current with a pulse equal to the number of revolutions of the assembly. In turn, the ac. current is fed to an electric timer which acts as a revolution counter. If the number of revolutions indicated on the scale of the tachometer coincides with the actual number of revolutions registered by the counter, the tachometer is functioning correctly. There is 1 diagram.

6060. BIOLOGICAL STUDIES ON THE PROBLEM OF TOXICITY OF BLOOD SERUM IN EPILEPSY OF UNKNOWN AETIOLOGY - Badania biologiczne nad zagadnieniem toksyczności surowicy krwi w padacze o nieznanej etiologii - Berezowski F. Szpit. dla Nerw. i Psychicznych Chorych, Kochorowa - NEUROL. NEUROCHIR. PSYCHIAT. POL. 1958, 8/3 (309-324)

The white mice were intraperitoneally inoculated with blood serum from epileptic patients, taken before breakfast (serum A) and after an epileptic fit (serum B). The control investigations were carried out with blood serum taken from schizophrenic and psychopathic patients. 34.6% of mice were dead after serum A, and 37.2% after serum B. In the control groups only 10% of mice died after the administration of schizophrenic blood serum. It is concluded that serum from epileptic patients has a toxic action, especially if it is taken immediately after an epileptic fit.

BEREZOWSKI, Stanislaw, Department of History of Medicine (Zakład Historii Medycyny), AM [Akademia Medyczna, Medical Academy] in Krakow (Director: Acting Professor, Dr. Z. KUKULSKI)

"The Beginnings of the Education of Surgeons at the Jagiellonian University (Uniwersytet Jagiellonski)."

Warsaw-Krakow, Przeglad Lekarski, Vol 19, Ser II, No 8, 28 Aug 63, pp 356-350

Abstract: Article on the early history of the department of surgery at the University of Krakow, which started in 1776, even prior to the Kollataj reforms at the university, at a time when the medical department numbered a faculty of two. It was ordered opened by Michal Poniatowski, with Rafal Józef Czerwiakowski acting as its father organizer and developer from 1779 to 1803, when he retired and his work taken over by Prof. Jan Rust. Emphasis is placed on his contribution to sound surgical practice and lecturing in Polish. There are 14 footnotes to Polish sources.
